

# **HOTEL MANAGEMENT SYSTEM**

## **MINOR PROJECT REPORT**

Submitted by

**K V NAVEEN KUMAR**

**21BCM025**

Under the Guidance of

**Dr.C.NAGARANI M.Sc.,MCA.,M.Phil.,Ph.D.**

Assistant Professor

Department of Computer Science

In partial fulfillment of the requirements for the award of the degree of

**Bachelor of Science in Computer Science**

Of Bharathiar University

**PSG COLLEGE OF ARTS & SCIENCE**  
**DEPARTMENT OF COMPUTER SCIENCE**

-Affiliated to Bharathiar University Accredited with

‘A++’ grade by NAAC (4<sup>th</sup> Cycle)

College with Potential for Excellence

(Status awarded by the UGC)

STAR College Status Awarded by DBT-MST

An ISO 9001:2015 Certified Institution

Coimbatore -641 014

**OCTOBER - 2023**

**PSG COLLEGE OF ARTS & SCIENCE**  
**DEPARTMENT OF COMPUTER SCIENCE**

An Autonomous College-Affiliated to Bharathiar University

Accredited with 'A++' grade by NAAC (4<sup>th</sup> Cycle)

College with Potential for Excellence

(Status awarded by the UGC)

STAR College Status Awarded by DBT-MST

An ISO 9001:2015 Certified Institution

Coimbatore -641 014

**CERTIFICATE**

This is to certify that this Project work entitled **HOTEL MANAGEMENT SYSTEM** is a bonafide record of work done by **K.V.NAVEEN KUMAR**, 21BCM025 for the award of Degree of Bachelor of Science in Computer Science of Bharathiar University.

---

Signature of the Faculty Guide

---

Signature of the HoD

Submitted for Viva-Voce Examination held on \_\_\_\_\_

---

Internal Examiner

---

External Examiner

## **DECLARATION**

I, **K.V.NAVEEN KUMAR (21BCM025)**, hereby declare that this Project work entitled **“HOTEL MANAGEMENT SYSTEM”**, is submitted to PSG College of Arts and Science (Autonomous), Coimbatore in partial fulfillment for the award of degree is a record of original work done by me under the supervision and guidance of **Dr.C.NAGARANI, M.Sc.,MCA.,M.Phil.,Ph.D., Assistant Professor**, Department of Computer Science, PSG College of Arts and Science, Coimbatore.

This Project work has not been submitted by me for the award of any other Degree/ Diploma/ Associate ship/ Fellowship or any other similar degree to any other university.

PLACE : Coimbatore

DATE : 20\10\2023

**K V NAVEEN KUMAR**

**21BCM025**

## ACKNOWLEDGEMENT

With great gratitude, I would like to acknowledge the help of those who contributed with their valuable suggestions and timely assistance to complete this work

First and foremost, I would like to extend my heartfelt gratitude and place my sincere thanks to **Thiru L. Gopalakrishnan** Managing Trustee, PSG & Sons' Charities, Coimbatore for providing all sorts of support and necessary facilities throughout the course.

I express my deep sense of gratitude to **Dr.T.Kannaian MSc., MTech., Ph.D** Secretary, PSG College of Arts & Science for infrastructure provided to undertake this work.

I whole heartedly express my gratitude to **Dr.D.Brindha MSc., MPhil., Ph.D., MA(Yoga)** Principal, PSG College of Arts & Science for her academic support and constant source of inspiration throughout the course.

I express my sincere thanks to **Dr.A.Anguraj, MSc., MPhil., Ph.D.,** Vice Principal (Self Financing Programmes) and **Mrs.M.Umarani, MBA., MPhil.,** Faculty-In- Charge(Student Affairs), for their support.

I owe my deepest gratitude to **Dr.S.Selvi, MCA., MPhil., Ph.D., SET NET** Associate Professor & Head, Department of Computer Science for her advice and encouragement to complete the project.

My sincere thanks to **Dr.C.NAGARANI M.Sc.,MCA.,M.Phil.,Ph.D., Assistant Professor,** Department of Computer Science for the valuable suggestions, support and guidance as my Internal Guide, without which my work would not have reached the present form.

I am greatly indebted to my parents and my friends for supporting me to complete this immense task.

## **SYNOPSIS**

The Project HOTEL MANAGEMENT SYSTEM is a web based application that allows the hotel manager to handle all hotel activities online. Interactive GUI and the ability to manage various hotel bookings and rooms make this system very flexible and convenient. The hotel manager is a very busy person and does not have the time to sit and manage the entire activities manually on paper. This application gives him the power and flexibility to manage the entire system from a single online system.

Hotel Management project provides room booking, staff management and other necessary hotel management features. The system allows the manager to post available rooms in the system. Customers can view and book room online. Admin has the power of either approving or disapproving the customer's booking request.

Other hotel services can also be viewed by the customers and can book them too. The system is hence useful for both customers and managers to portably manage the hotel activities.

# **1. INTRODUCTION**

## **1.1. PROJECT OVERVIEW**

Hotel Management System is a system that provides us to reserving rooms, checking whether the rooms are vacant are or not by using online browsing. This system is very useful to all especially for business people.

For Business people they don't have sufficient time for these then they can use these type of Online Hotel Management Systems. By this project we will reduce the faults in bills of their expenditure and decrease time of delay to give the bills to the customers. We can also save the bills of the customer. By this project we can also include all the taxes on the bills according to their expenditures. It has a scope to reduce the errors in making the bills. Computerized bill can be printed within fraction of seconds. Online ordering of Booking is possible by using this software. This Project is based on php. If any one wants to book the room for few days then they can specify the specific number by seeing the types of rooms we have. The bill of this online booking is based on the type of room they can select is displayed.

HOTEL MANAGEMENT SYSTEM is a hotel reservation site script where site users will be able to search rooms availability with an online booking reservations system. Site users can also browse hotels, view room inventory, check availability, and book reservations in real-time. Site users enter check in date and check out date then search for availability and rates. After choosing the right room in the wanted hotel – all booking and reservation process is done on the site.

## **1.2. OBJECTIVE OF THE PROJECT**

The purpose of hotel booking system is to automate the existing manual system by the help of computerized equipments and full fledged computer software, fulfilling their requirement, so that their valuable or information can be stored for a longer period with easy accessing and manipulating of the same . The required software and hardware are easily available and easy to work with.

This proposes that efficiency of hotel organizations could be improved by integrating service-oriented operations service-oriented operations with project management principles. Such integration would instill innovation, proactive attitudes and regulated risk-taking needed to pursue ongoing improvement and proactive response to change. By managing each change as a project, embedded in smoothly running operations, hotels would extend their life span by continuously reinventing themselves.

## **1.3. MODULES**

### **ADMIN**

- Login
- Dashboard
- Rooms
- Payment
- Staffs
- Customers
- Reports
- Logout

### **USER**

- Login
- Room Reservation
- Logout

### **1.3.1. MODULE DESCRIPTION**

#### **1. Admin:**

Admin has a control over the whole project. This contains sub modules such as Admin login module, Staff module, Rooms, Report module etc. Administrator can handle both the front end and back end process of the system.

#### **2. Dashboard:**

The Dashboard modules is the first page of admin where he can see all the details of the hotel like total customers, staffs total room booked. There are two graph which in which one is pipe chart which shows types of room booked and other one is bar graph which shows payments on dates basis

#### **3. Room Book:**

In this module the admin can see the booking details of the customer. Once the user books a room the details are displayed here where the admin can confirm the booking. The admin can edit/delete/add the details and can check-out in advance.

#### **4. Payments:**

Payment module is used to manage the payments made by the customers. The admin can print the invoice of the customer after checkout and also delete the records.

#### **5. Staffs:**

All the workers details of the hotel are displayed in this module. The admin can add/delete/edit the details of the customer

#### **6. Customers:**

This module show all the details of the customers who have user account in the hotel. The admin can add/edit/delete the details of the customers.

#### **7. Reports:**

Report module is used to display all the booking details within the given dates or for a particular month. The admin can download the data.

#### **8. User:**

User can view only front end process of the system. In this module user can view the information of the hotel, room details and reservation.

#### **9. Room Reservation:**

In this module, the user can book a room in advance by providing the appropriate details in the form. Once the user books a room then the confirmation message is sent to the admin

#### **10. Login:**

Both the admin and user can login the hotel website by providing the username and password.

#### **11. Logout:**

After performing all the operations both the admin and user can logout using this logout module

## **2. SYSTEM SPECIFICATION**

### **2.1. HARDWARE CONFIGURATION**

- Processor : Intel core2 Dual
- RAM : 6.00 GB
- System Type : 64-bit operating system, x64-based processor

### **2.2. SOFTWARE CONFIGURATION**

- Front-end Language : Php, Css, Javascript
- Back-end Language : MySQL
- Web Server : XAMPP Server

## 2.2.1 SOFTWARE DESCRIPTION

### PHP :

PHP is a powerful server-side scripting language for creating dynamic and interactive websites. PHP widely used; free and efficient alternative to competitors such as

Microsoft's ASP. PHP is perfectly suited for Web development and can be embedded directly into the HTML code. The PHP syntax is similar to perl and C.

PHP is open source that it is readily available and absolutely free. Stability, flexibility and speed are chief qualities that attract to choose PHP. PHP have multiple extensions and is extremely scalable.

#### Server-side scripting

This server-side scripting is the most traditional and main target field for PHP. Programmer needs three things to make this work. Programmer need to run the web server, with a connected PHP installation. Programmer can access the PHP program output with a web browser, viewing the PHP page through the server. All these can run on your home machine if programmers are just experimenting with PHP programming.

#### Command line scripting

Programmer can make a PHP script to run it without any server or browser. Programmers only need the PHP parser to use it this way. This type of usage is ideal for scripts regularly executed using cron (on \*nix or Linux) or Task Scheduler (on Windows).

These scripts can also be used for simple text processing tasks. **Features of PHP**

- PHP runs on different platforms (Windows, Linux, UNIX, etc.)
- PHP is compatible with almost all servers used today.
- PHP is free to download from the official PHP resource: [www.php.net](http://www.php.net).

### MYSQL :

MySQL is an open-source relational database management system (RDBMS) is developed, distributed and supported by MySQL AB. MySQL is a popular choice of database for use in web applications MySQL can be scaled by deploying it on more powerful hardware, such as a multi-processor server with gigabytes of memory. MySQL is easy to use, yet extremely powerful, secure, and scalable. And because of its small size and speed, it is the ideal database solution for Web sites.

MySQL is a database management system

A database is a structured collection of data. It may be anything from a simple shopping list to a picture gallery

or the vast amount of information in a corporation network. To add, access and process data stored in a computer database we need a database management system.

MYSQL server. Since computers are very good at handling large amount of data, database management system plays a central role in computing.

MYSQL is a relational database management system

A relational database stores separate data in separate tables rather than putting all the data in one big storeroom. This adds speed and flexibility. The SQL part of “MYSQL” stands for “Structured Query Language”. SQL is the most common standardize language used to access database and is defined by the ANSI/ISO SQL standard. The SQL standard has been evolving since 1986 and several versions exist.

MYSQL software is open source

Open source means that it is possible for anyone to use modify the software. Anybody can download the MYSQL software uses the GPL (GNU General Public License), to define what we may and may not use do with the software.

MYSQL Server works in Client/ Server or embedded systems

The MYSQL database software is a client/server system that consists of a multithreaded SQL server that supports different backend, several different client programs and libraries, administrative tools and a wide range of Application Programming Interface(APIs). A large amount of contributed MYSQL software is available:

Modern day websites seem to be relying more and more on compel the Structured Query Language is a very popular database language, and its standardization makes it easy to store, update and access data. One of the most powerful SQL servers out there is called

MYSQL and surprisingly enough, it's free.

Some of the features of MYSQL include: Handles large databases, in the area of 50,000,000+records. No memory leaks. Tested with a commercial memory leakage detector (purify). A privilege and password system which is very flexible and secure, and which allows host-based verification. Passwords are secure since all password traffic when connecting the server is encrypted.

Features of MYSQL

**Client/server Architecture:** MYSQL is a client/server system. There is a database server (MYSQL) and arbitrarily many clients (application programs), which communicate with the server. The clients can run on the same computer as the server or on another computer.

**SQL Compatibility:** As before said SQL is a standardized language for querying and updating data and for the administration of a database. Through the configuration setting solmode we can make the MYSQL server

behave for the most part compatibly with various database systems.

**Stored procedures:** Stored procedures (SPs for short) are generally used to simplify steps such as inserting or deleting a data record.

**Triggers:** Triggers are SQL commands that are automatically executed by the server in certain database operations INSERT, UPDATE, and DELETE, MYSQL has supported triggers.

**Replication:** Replication allows the contents of a database to be copied (replicated) onto a number of computers to increase protection against system and to improve the speed of database queries.

**Platform independence:** MYSQL can be executed under a number of operating systems. The most important are Apple Macintosh OS X, Linux, Microsoft Windows, and the Unix.

**Speed:** MYSQL is considered a very fast database program.

## **3. SYSTEM ANALYSIS**

### **3.1. EXISTING SYSTEM**

Hotel Management involves maintaining various operations of the hotel like Booking or reservations of the rooms, Cancellation of the rooms, Cash billing, Room service, Restaurant service, Total billing, Travels arrangement etc. The existing system is a manual one and there is lot of issues like erroneous data, slow process, lack of security etc. Finding out the final payment amount completely relies on the hotel manager and if he is absent, it takes a long time to find out the details during check out and is prone to errors.

#### **Drawbacks of the Existing System**

- Manual entry consumes more time.
- It is difficult to maintain bulk of record in manual.
- Restrictions in the users.
- Not easy to prepare the daily reports.
- Lack of accuracy and error prone.
- Overall efficiency is less.
- Lot of paperwork.
- Non-secure.
- No perfect maintenance of report.
- No method to trace details
- Human errors
- The manual system is too slow

### **3.2. PROPOSED SYSTEM**

The Automated system with distributed architecture can support issues like.

- The system maintains the different location that are available and registered in a central DB, which leads easy accessibility and consistency.
- Each Accommodation available units and all the unit facilities are also available at the click of a mouse.
- The registration of new guest is online house new guest can make them they convenient for registration process on the basic of 24x7x326days.
- The Units can be booked by the Registered guest irrespective of the Geographical barriers.
- The Guest are provided with up to minute information related to the unit availability and their status. From their convenient place.
- The decision process in more faster and more consistent.
- The guest have information at their demand related to any unit status of their own unit booking status.

## 4. SYSTEM DESIGN

### 4.1. INPUT DESIGN

Input design is the process of converting the user-oriented. Input to a computer based format. The goal of the input design is to make the data entry easier, logical and free error. Errors in the input data are controlled by the input design. The quality of the input determines the quality of the system output.

The entire data entry screen is interactive in nature, so that the user can directly enter into data according to the prompted messages. The users are also can directly enter into data according to the prompted messages. The users are also provided with option of selecting an appropriate input from a list of values. This will reduce the number of error, which are otherwise likely to arise if they were to be entered by the user itself.

The image shows a web-based reservation form titled "RESERVATION". The form is divided into two main sections: "Guest information" and "Reservation information".

**Guest information:**

- Name: Naveen Kumar
- Email: naveen@gmail.com
- Country: India (dropdown menu)
- Phone Number: 9976034443

**Reservation information:**

- Guest House: (dropdown menu)
- Room Type: Double (dropdown menu)
- Number of Guests: 1 (dropdown menu)
- Meal: (dropdown menu)
- Check-In: 17-10-2023 (calendar icon)
- Check-Out: 19-10-2023 (calendar icon)

At the bottom of the form is a green "Submit" button.

## 4.2. OUTPUT DESIGN

Output design is very important concept in the computerized system, without reliable output the user may feel the entire system is unnecessary and avoids using it. The proper output design is important in any system and facilitates effective decision-making. The output design of this system includes various reports. Computer output is the most important and direct source of information the user.

Efficient, intelligible output design should improve the system's relationships with the user and help in decision making. A major form of output is the hardcopy from the printer.

## **5. SYSTEM TESTING AND IMPLEMENTATION**

### **5.1. SYSTEM TESTING**

#### **TESTING**

Testing is a series of different tests that whose primary purpose is to fully exercise the computer based system. Although each test has a different purpose, all work should verify that all system element have been properly integrated and performed allocated function. Testing is the process of checking whether the developed system works according to the actual requirement and objectives of the system.

The philosophy behind testing is to find the errors. A good test is one that has a high probability of finding an undiscovered error. A successful test is one that uncovers the undiscovered error. Test cases are devised with this purpose in mind. A test case is a set of data that the system will process as an input. However the data are created with the intent of determining whether the system will process them correctly without any errors to produce the required output. Types of Testing

- Unit testing
- Integration testing
- Validation testing
- Output testing
- User acceptance testing
- White box testing
- Black box testing

#### **Unit Testing**

All modules were tested and individually as soon as they were completed and were checked for their correct functionality.

#### **Integration Testing**

The entire project was split into small program; each of these single programs gives a frame as an output. These programs were tested individually; at last all these programs where combined together by creating another program where all these constructors were used. It give a lot of problem by not functioning is an integrated manner.

The user interface testing is important since the user has to declare that the arrangements made in frames are

convenient and it is satisfied. When the frames were given for the test, the end user gave suggestion. Based on their suggestions the frames were modified and put into practice.

### **Validation Testing**

At the culmination of the black box testing software is completely assembled as a package. Interfacing errors have been uncovered and corrected and a final series of test i.e., Validation succeeds when the software function in a manner that can be reasonably accepted by the customer.

### **Output Testing**

After performing the validation testing the next step is output testing of the proposed system. Since the system cannot be useful if it does not produce the required output. Asking the user about the format in which the system is required tests the output displayed or generated by the system under consideration. Here the output format is considered in two ways. One is on screen and another one is printed format. The output format on the screen is found to be corrected as the format was designed in the system phase according to the user needs. And for the hardcopy the output comes according to the specifications requested by the user.

### **White box testing**

White box testing (also known as Clear Box Testing, Open Box Testing, Glass Box Testing, Transparent Box Testing, Code-Based Testing or Structural Testing) is a software testing method in which the internal structure/design/implementation of the item being tested is known to the tester. The tester chooses inputs to exercise paths through the code and determines the appropriate outputs.

Programming know-how and the implementation knowledge is essential. White box testing is testing beyond the user interface and into the nitty-gritty of a system.

This method is named so because the software program, in the eyes of the tester, is like a white/transparent box; inside which one clearly sees. Definition by ISTQB

- White-box testing: Testing based on an analysis of the internal structure of the component or system.
- White-box test design technique: Procedure to derive and/or select test cases based on an analysis of the internal structure of a component or system.

### **Black box testing**

Black box testing, also known as Behavioral Testing, is a software testing method in which the internal structure/design/implementation of the item being tested is not known to the tester. These tests can be functional or non-functional, though usually functional.

This method is named so because the software program, in the eyes of the tester, is like a black box; inside which one cannot see. This method attempts to find errors in the following categories:

- Incorrect or missing functions
- Interface errors
- Errors in data structures or external database access
- Behavior or performance errors
- Initialization and termination errors Definition by ISTQB
- Black box testing: Testing, either functional or non-functional, without reference to the internal structure of the component or system.
- Black box test design technique: Procedure to derive and/or select test cases based on an analysis of the specification, either functional or non-functional, of a component or system without reference to its internal structure.

### **Acceptance testing**

This testing is done to verify the readiness of the system for the implementation. Acceptance testing begins when the system is complete. Its purpose is to provide the end user with the confidence that the system is ready for use. It involves planning and execution of functional tests, performance tests and stress tests in order to demonstrate that the implemented system satisfies its requirements. Tools of special importance during acceptance testing include:

Test coverage Analyzer

Records the control paths followed for each test case.

Timing Analyzer

Also called a profiler, reports the time spent in various regions of the code and areas to concentrate on to improve system performance.

## **5.2. SYSTEM IMPLEMENTATION**

Implementation is the stage in the project where the theoretical design is turned into a working system and is giving confidence on the new system for the users that it will work efficiently and effectively. It involves careful planning, investigation of the current system and its constraints on implementation, design of methods to achieve the change over, an evaluation of change over methods. Apart from planning major task of preparing the implementation are education and training of users. The implementation process begins with preparing a plan for the implementation of the system.

According to this plan, the activities are to be carried out, discussions made regarding the equipment and resources and the additional equipment has to be acquired to implement the new system. In network backup system no additional resources are needed. Implementation is the final and the most important phase. The most critical stage in achieving a successful new system is giving the users confidence that the new system will work and be effective. The system can be implemented only after thorough testing is done and if it is found to be working according to the specification. This method also offers the greatest security since the old system can take over if the errors are found or inability to handle certain type of transactions while using the new system. As the part of system testing we execute the program with the intent of finding errors and missing operations and also a complete verification to determine whether the objectives are met and the user requirements are satisfied. The ultimate aim is quality assurance.

## **6. SCOPE FOR FUTURE ENHANCEMENT**

Mobile Integration: Developing mobile apps for guests to book rooms, order services, and receive notifications can enhance convenience. Blockchain Technology: Enhancing the security of guest information and transactions through blockchain. Sustainability Features: Incorporating sustainability initiatives like energy-saving systems and waste reduction in the hotel's operations. Multi-language Support: Expanding language support to accommodate international guests. Enhanced Analytics: Deeper data analytics for understanding guest preferences, occupancy trends, and pricing strategies. Payment Innovations: Integrating with various payment methods, including crypto currencies. Feedback and Review Management: Developing mechanisms to collect and respond to guest feedback in real-time.

## 7. CONCLUSION

In conclusion, the development and implementation of the hotel management system have been a significant milestone in enhancing the efficiency and customer service within our hotel. This project has successfully addressed several critical aspects of hotel management, such as reservation handling, check-in/check-out procedures, room allocation, billing, housekeeping, inventory management, and employee scheduling.

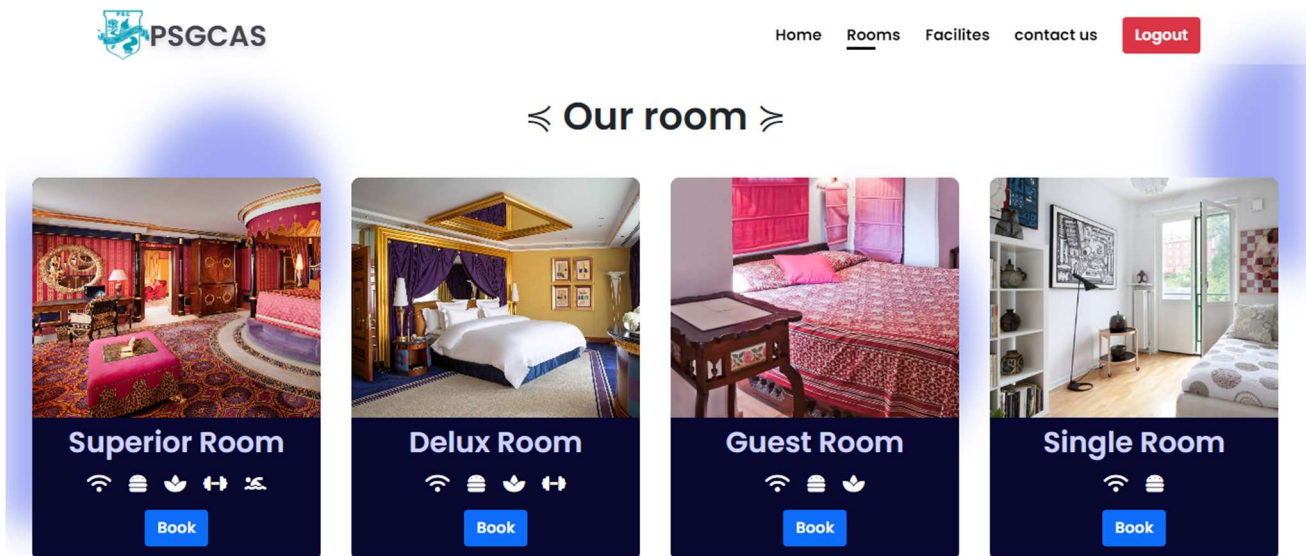

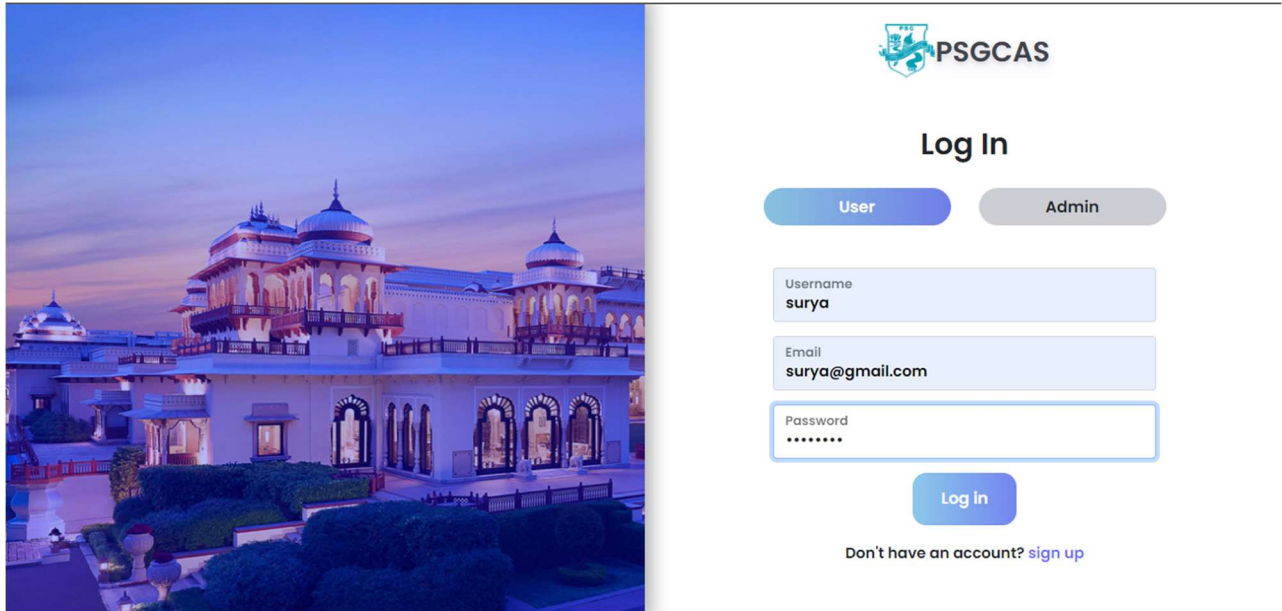

Throughout the course of this project, we encountered various challenges, such as integrating legacy systems, ensuring data security, and training staff to use the new system effectively. However, the benefits and positive outcomes outweighed these challenges.

The benefits of the hotel management system include:

- **Improved Customer Experience:** The system provides a seamless and convenient experience for guests, from reservation to check-out, leading to increased guest satisfaction.
- **Enhanced Operational Efficiency:** Automation of various tasks, such as billing and inventory management, has reduced errors, saved time, and improved resource utilization.
- **Data-Driven Decision-Making:** The system offers powerful reporting and analytics, enabling the management to make informed decisions and optimize hotel performance.
- **Staff Productivity:** Employee management and scheduling features have improved staff productivity and job satisfaction.
- **Security:** Stringent security measures have been implemented to protect guest data and ensure privacy.
